

Conserve Energy and Save Money!

There is no better time than now to lower your monthly energy costs. Here are some great tips you can start using to save money and become more eco friendly:

Switch to a Variable Speed Pump & Save

To keep your pool adequately filtering, you should be running your pool pump 8-10 hours in the summertime which can become quite expensive. By switching to a Variable Speed pump, you can run your pool pump at a lower horsepower which will lower your electric bill without sacrificing the quality and color of your pool water.

Cover Conservation with a Pool Cover

Solar pool covers can add up to 10% more heat, keep your pool and spa cleaner and reduce water loss from evaporation. For those who take the pool cover off during the fall and winter seasons, put the cover back on a month early the sun alone may heat the water twenty more degrees.

Set Your Pool at 78°F

Set your pool temperature to 78°F to conserve on energy costs. Every single degree significantly increases energy costs. If you want warmer water temperatures, consider using a solar pool cover or a solar panel system. If you have an old pool heater, replace the old model with a newer, more energy efficient unit.

Clean Pool Filters Only When Necessary

Watch pressure gauges and look for an 8 10 psi increase before cleaning.

Heat Your Spa to 102°F

You can cut costs dramatically by maintaining a temperature of 102°F. This is also the temperature recommended by most health departments for adults and children.

Turn Spa the Heater Down or Off

If you will not be using your spa or hot tub for a week or more turn the heat down or off.
